model building

model visualization

Knowledge

models

statistics/
machine learning

visual analytics

- ▶ lots of standard charts
- ▶ lots of domain specific visualizations
- ▶ lots of combinations (polymetric views)
- ▶ new visualization

mapping

visualization

▶ there is no single visual analytics solution

▶ solutions are domain specific

▶ heterogeneity (even within domains)

model visualization

models

statistics/
machine learning

- ▶ lots of different models
- ▶ lots of algorithms, heuristics, optimizations
- ▶ lots of parameters

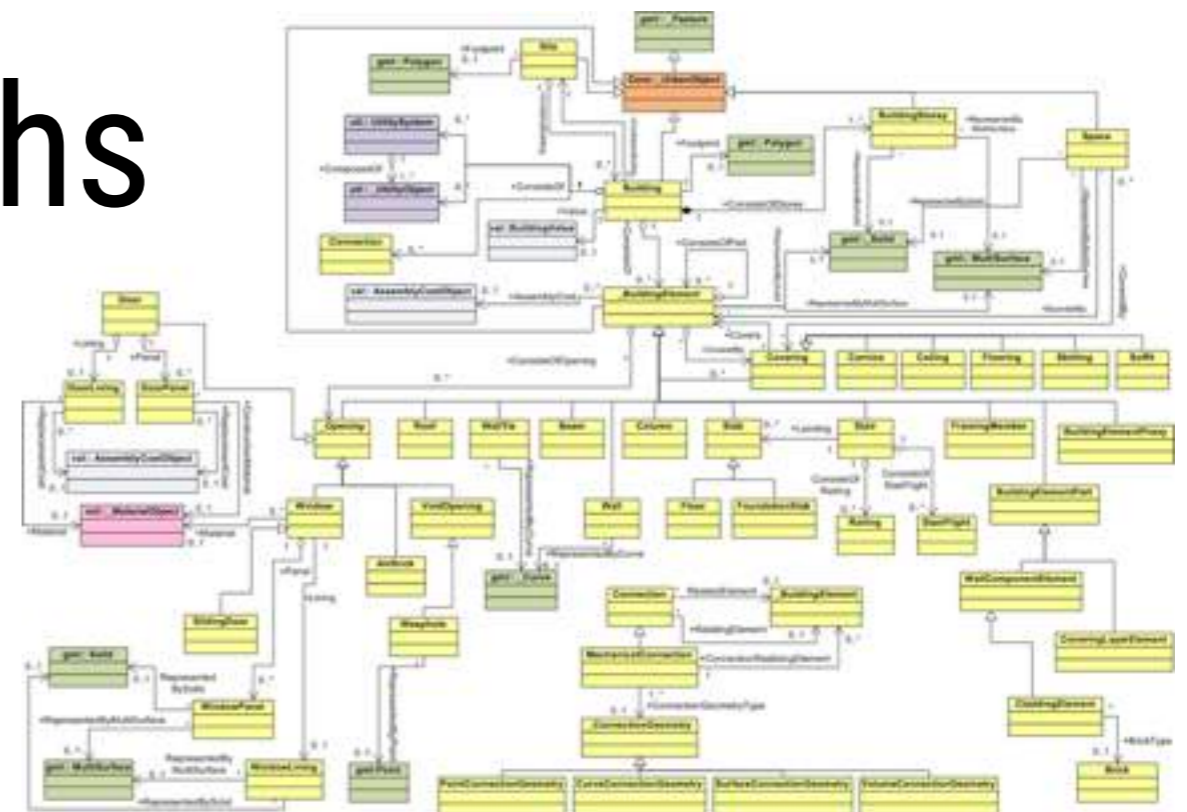

mapping

visualization

Project	Program To Modify	Overall Complexity	Total LOC	LOC of Largest Subr	LOC of Largest IF/DO Block	Greatest Depth of IF/DO	Decision Density	Average Variable Span
117-New tax	BL219R	1	29	12	0	0	1	0
	BL230R	0	13	0	0	0	1	1
	IF305R	-5	-59	0	0	-2	-2	-1
119-Change regions	CU290R	0	12	12	0	1	1	0
	SL300R	5	86	23	0	0	3	1

- ▶ hierarchies, trees
- ▶ dependencies, graphs
- ▶ metrics, tables

visualization

► hierarchies, trees

(a) polymetric graph

(b) tree map

(c) sunburst chart

► dependencies, graphs

(d) chord chart

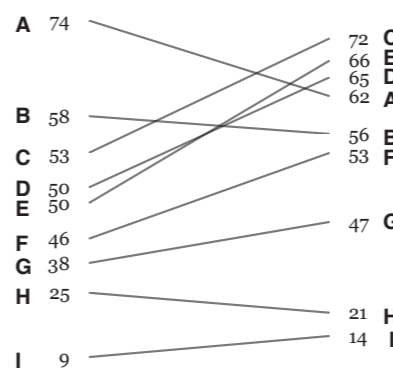

(e) dependency matrix

(f) radar chart

► metrics, tables

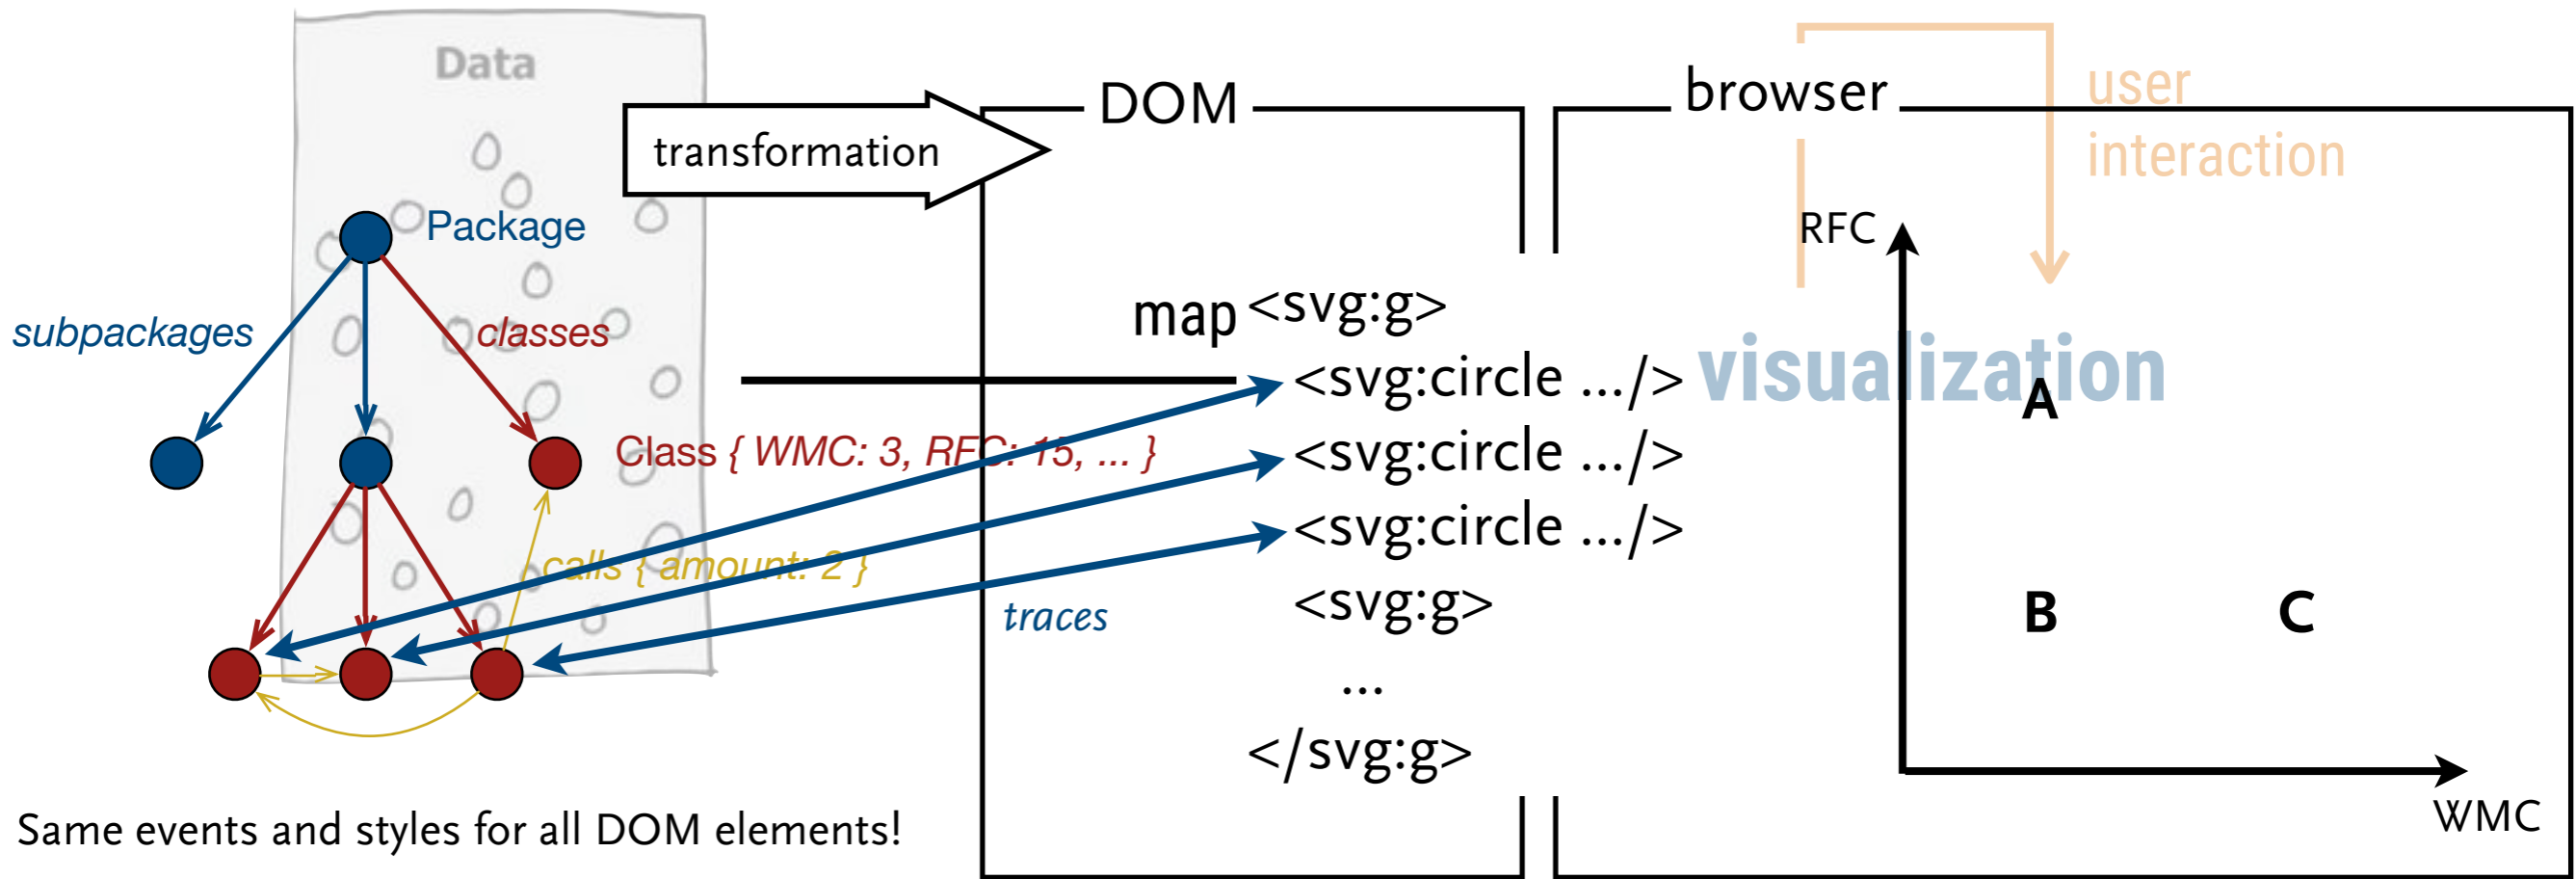

(g) slopechart

(h) parallel coordinates

(i) scatter plot matrix

Product

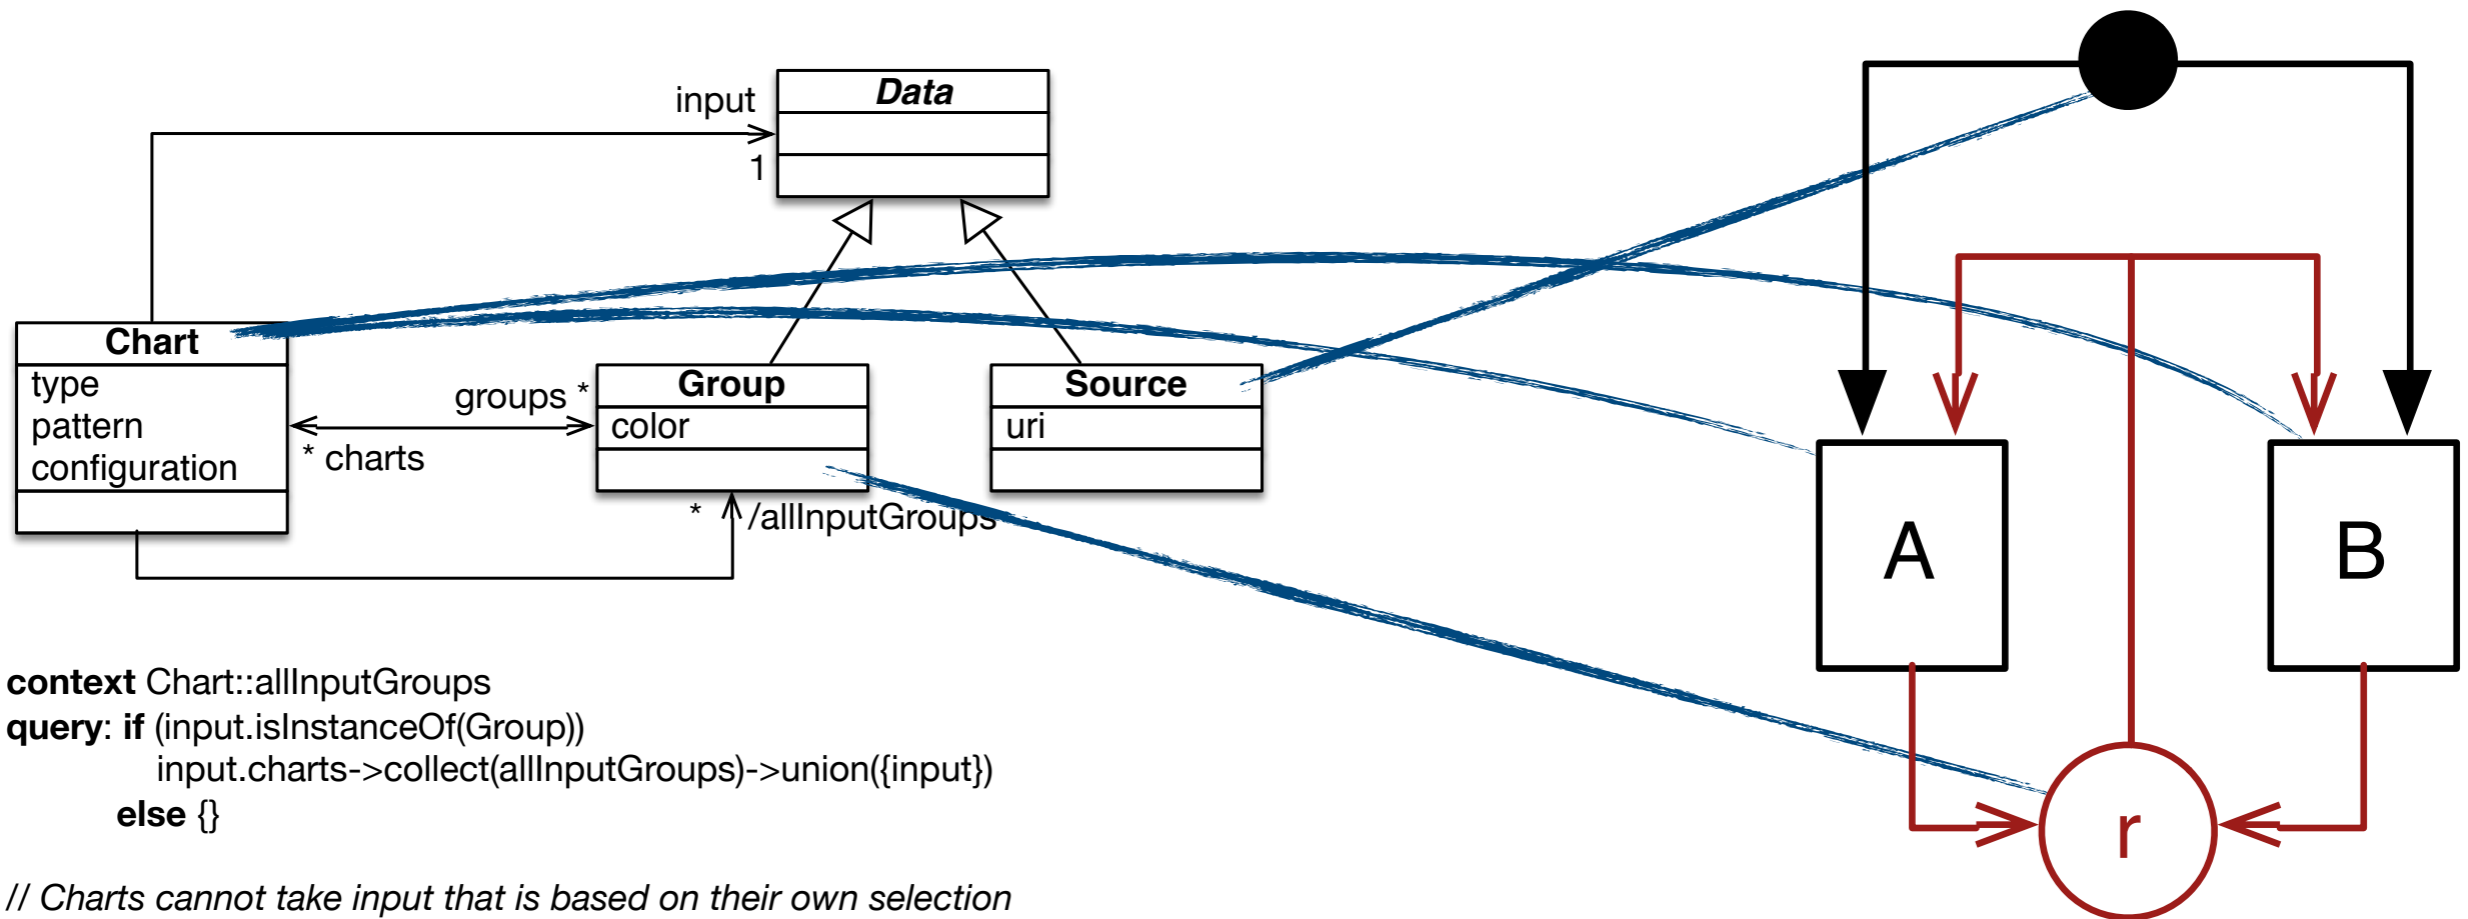

$$\left(\frac{10}{\text{€}}\right)$$

$$\frac{10}{100} \text{€}$$

$$(10, 11 \} 3 \text{€})$$

demo

Interactive Visualization Language

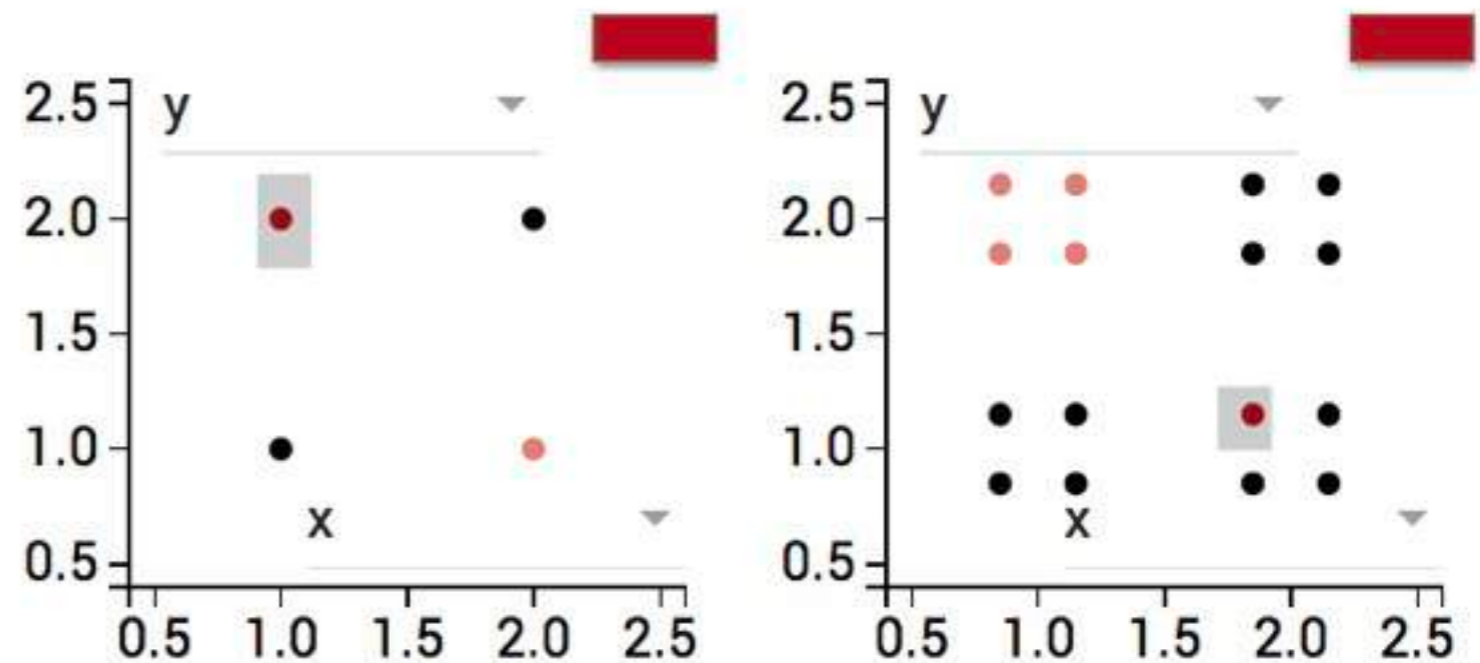

```

context Chart::allInputGroups
query: if (input.isInstanceOf(Group))
    input.charts->collect(allInputGroups)->union({input})
else {}
    
```

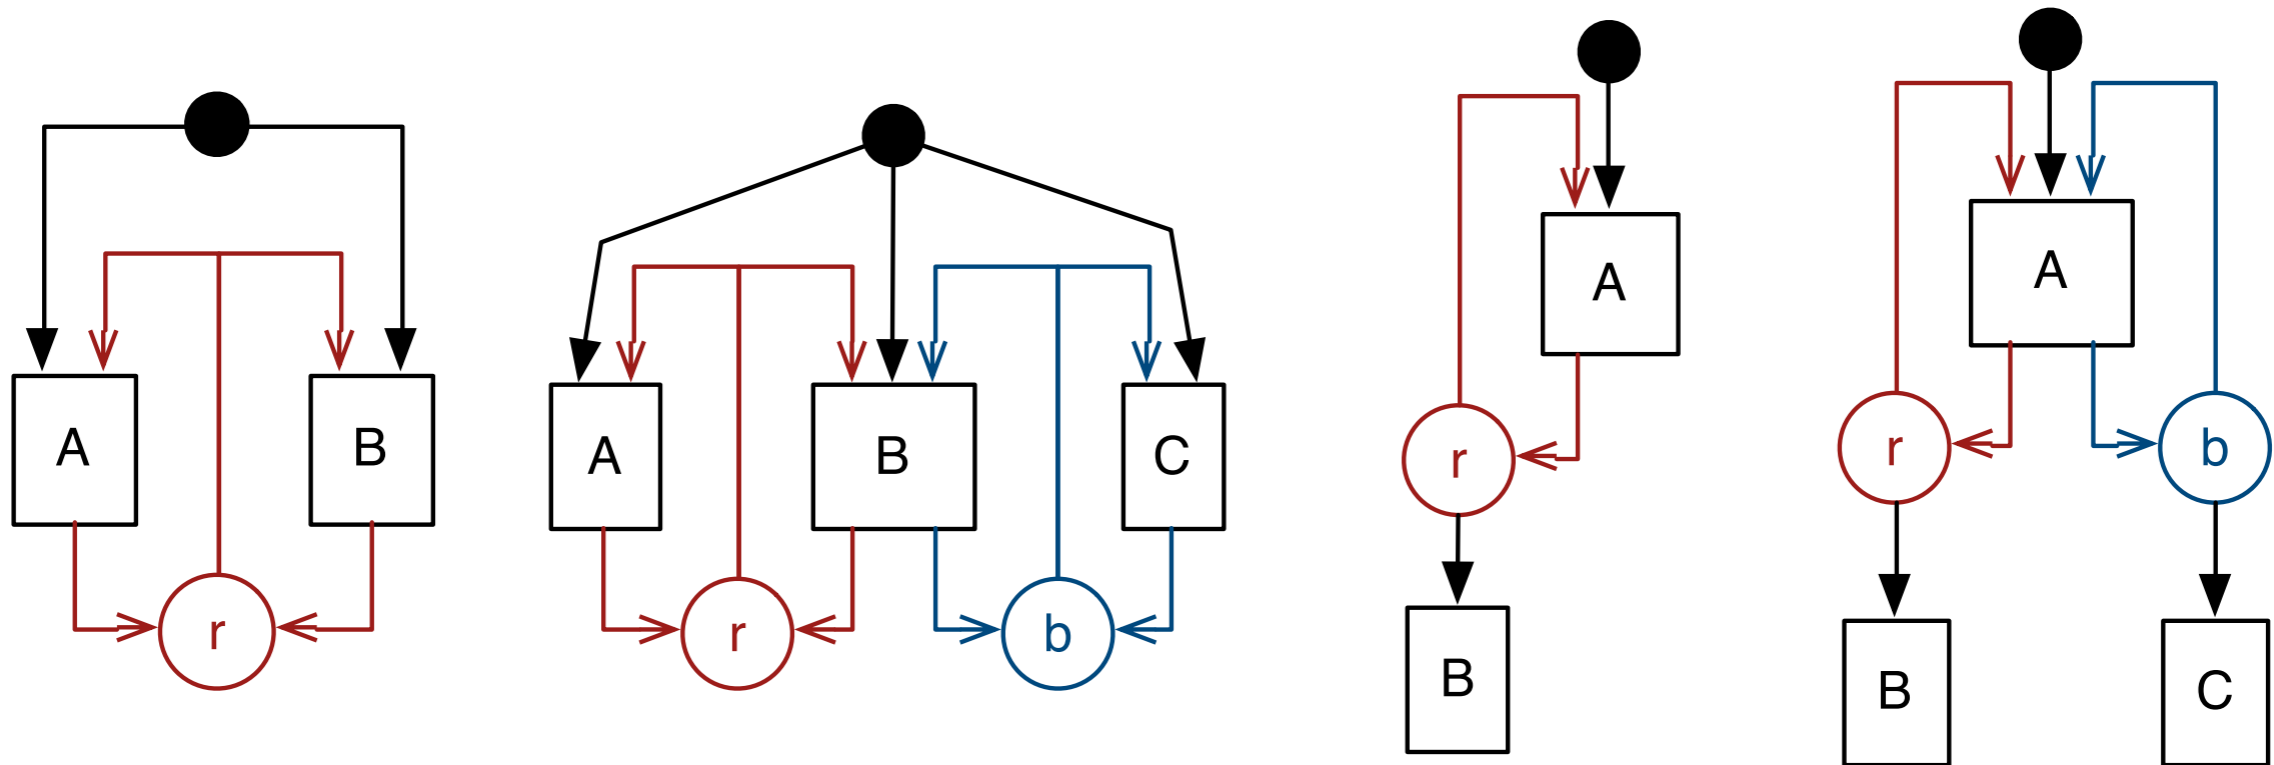

// Charts cannot take input that is based on their own selection

```

context Chart
inv: not allInputGroups->collect(charts)->contains(self)
    
```

Interactive Visualization Language

Interactive Visualization Language

D is a set of data-points

$I \subseteq D$ the set of input data-points

sel_C a selection function for each chart

$$I^C = sel_C(I) \subseteq children^*(I)$$

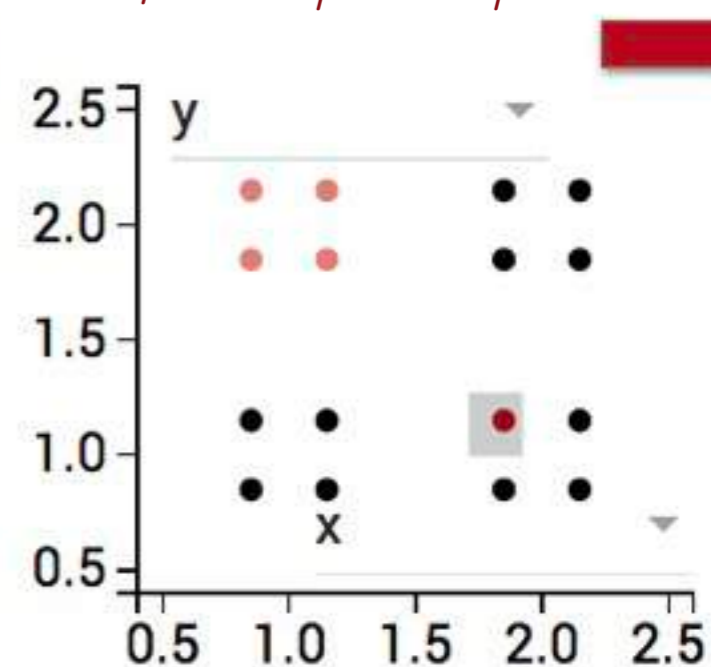

$$iS_r^C = \{d \in I^C \mid \exists d' : d \in parent^*(d' \vee d' \in parent^*(d))\}$$

dS_r^C a user selection with $dS_r^C \subseteq I^C \subseteq D$

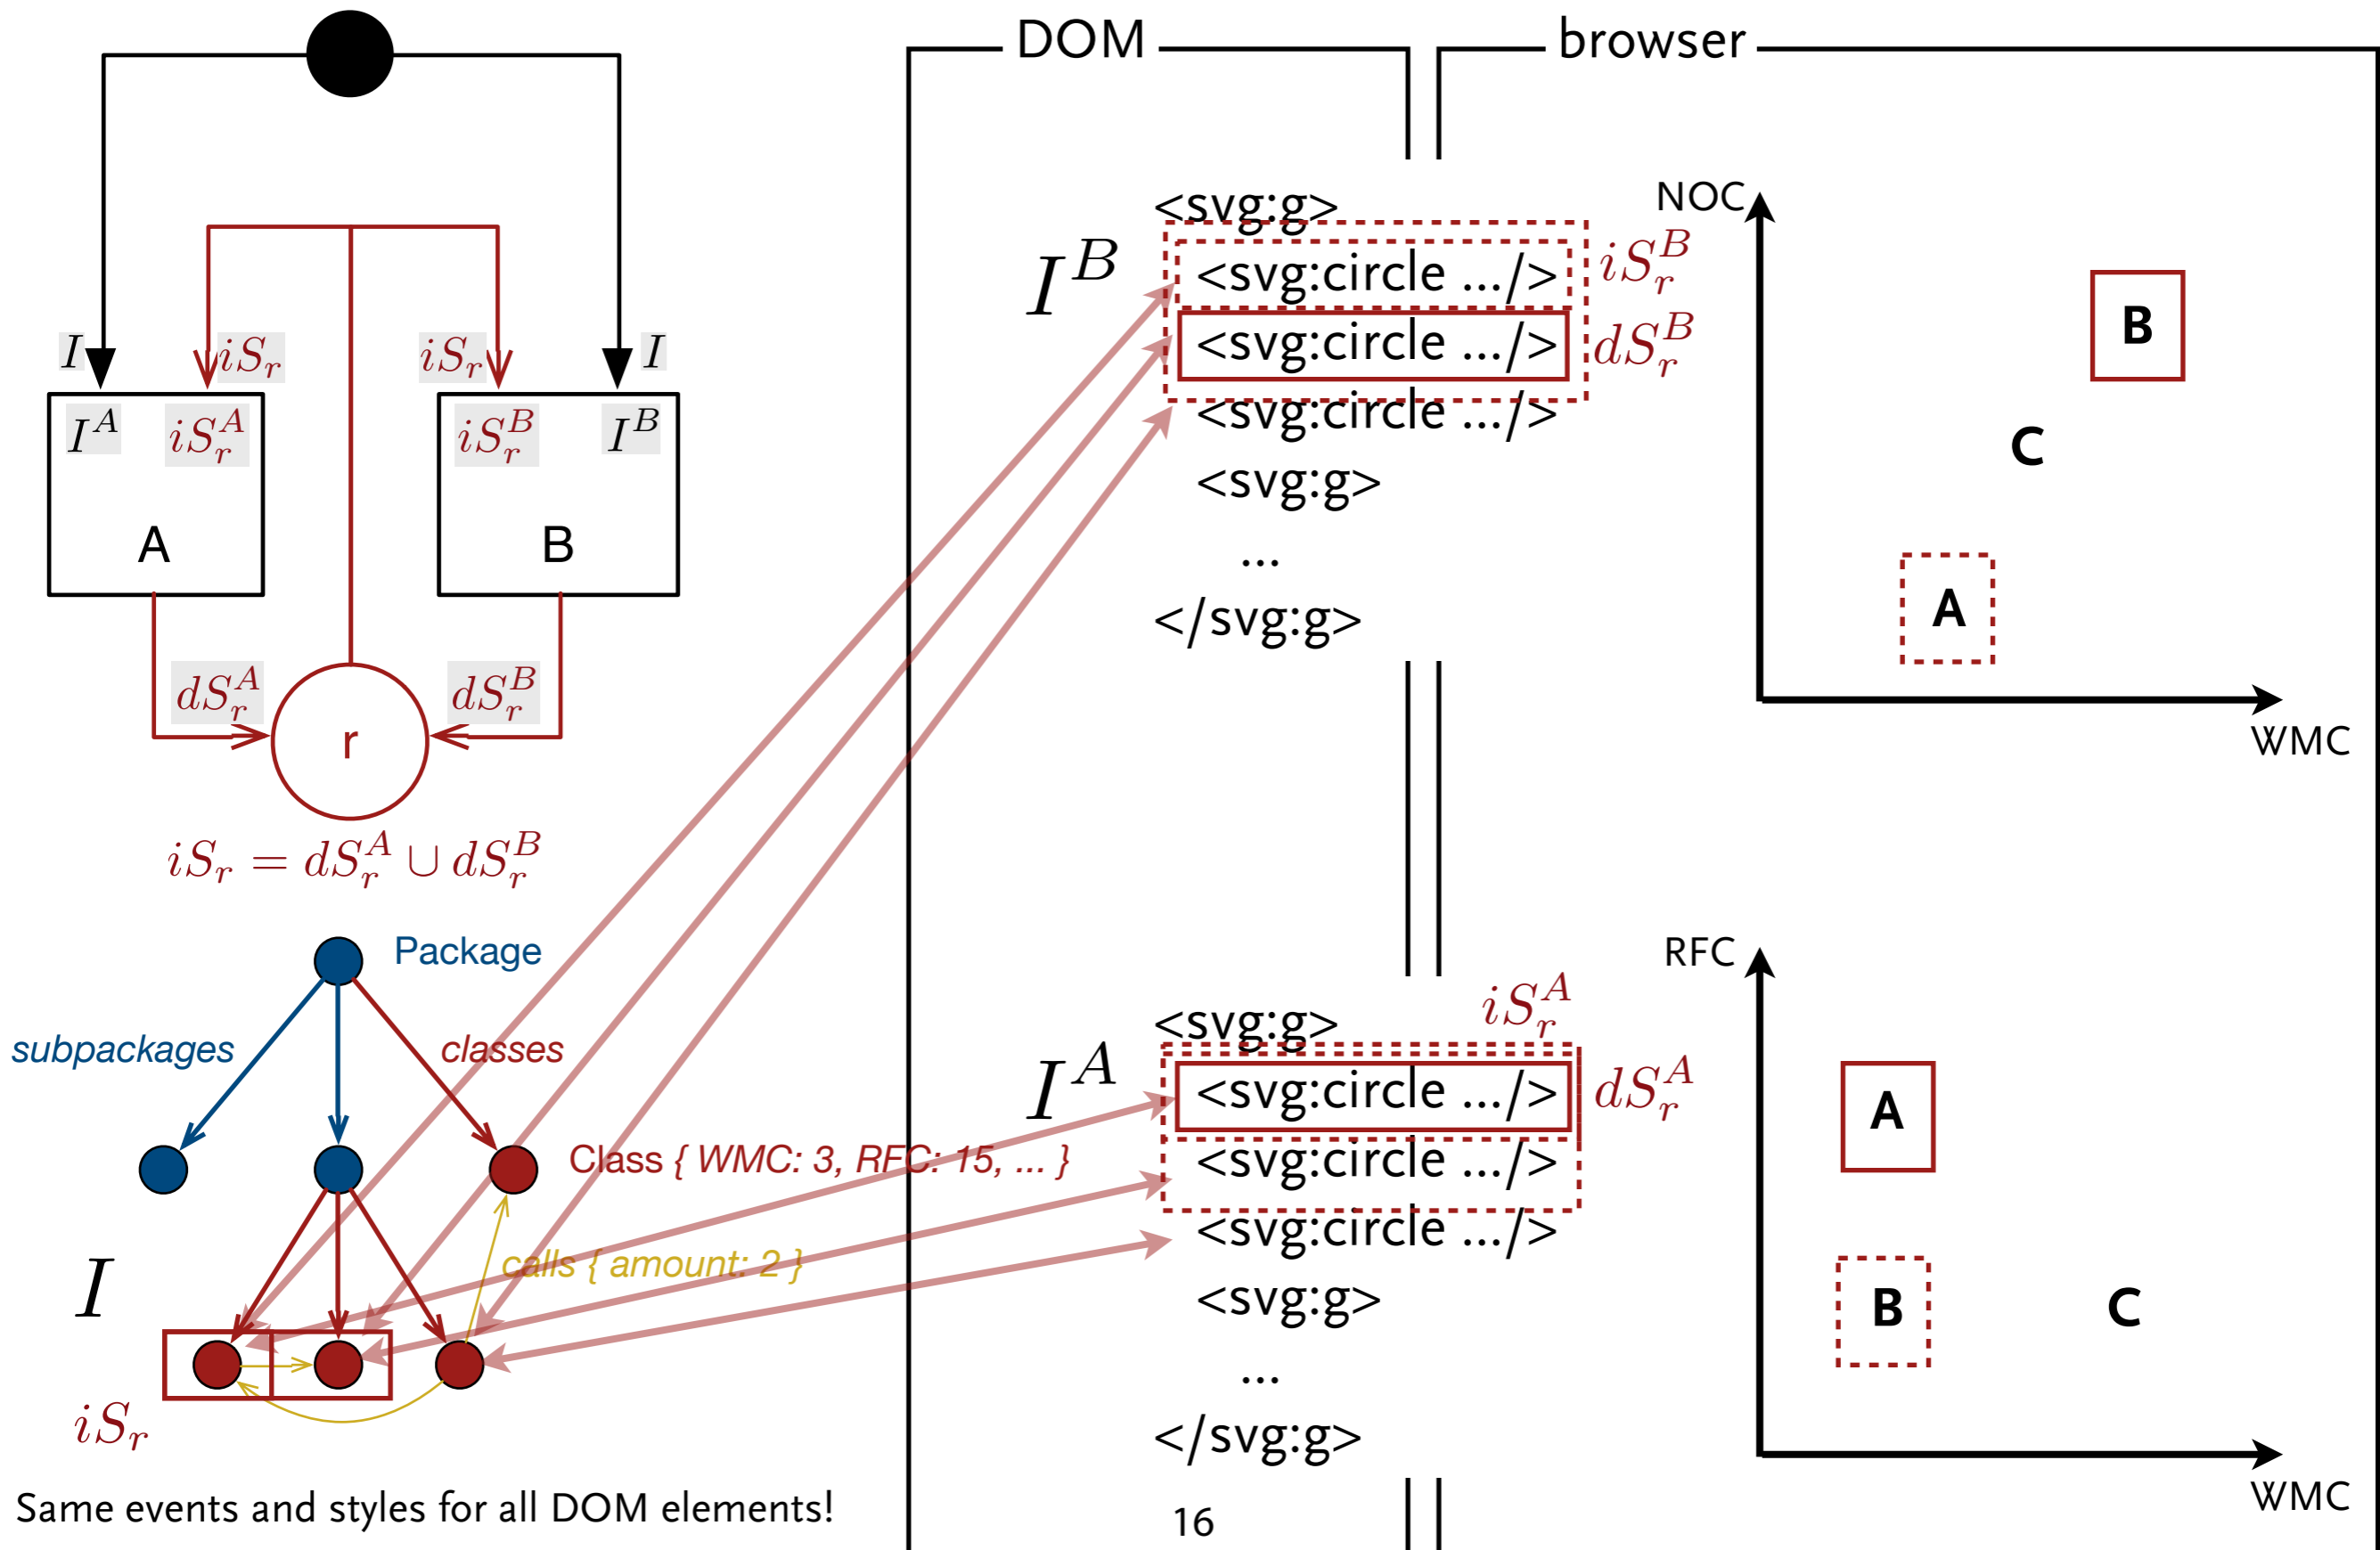

$$iS_r = \bigcup_{C \in charts(r)} dS_r^C$$

$$iS_r = dS_r^A \cup dS_r^B$$

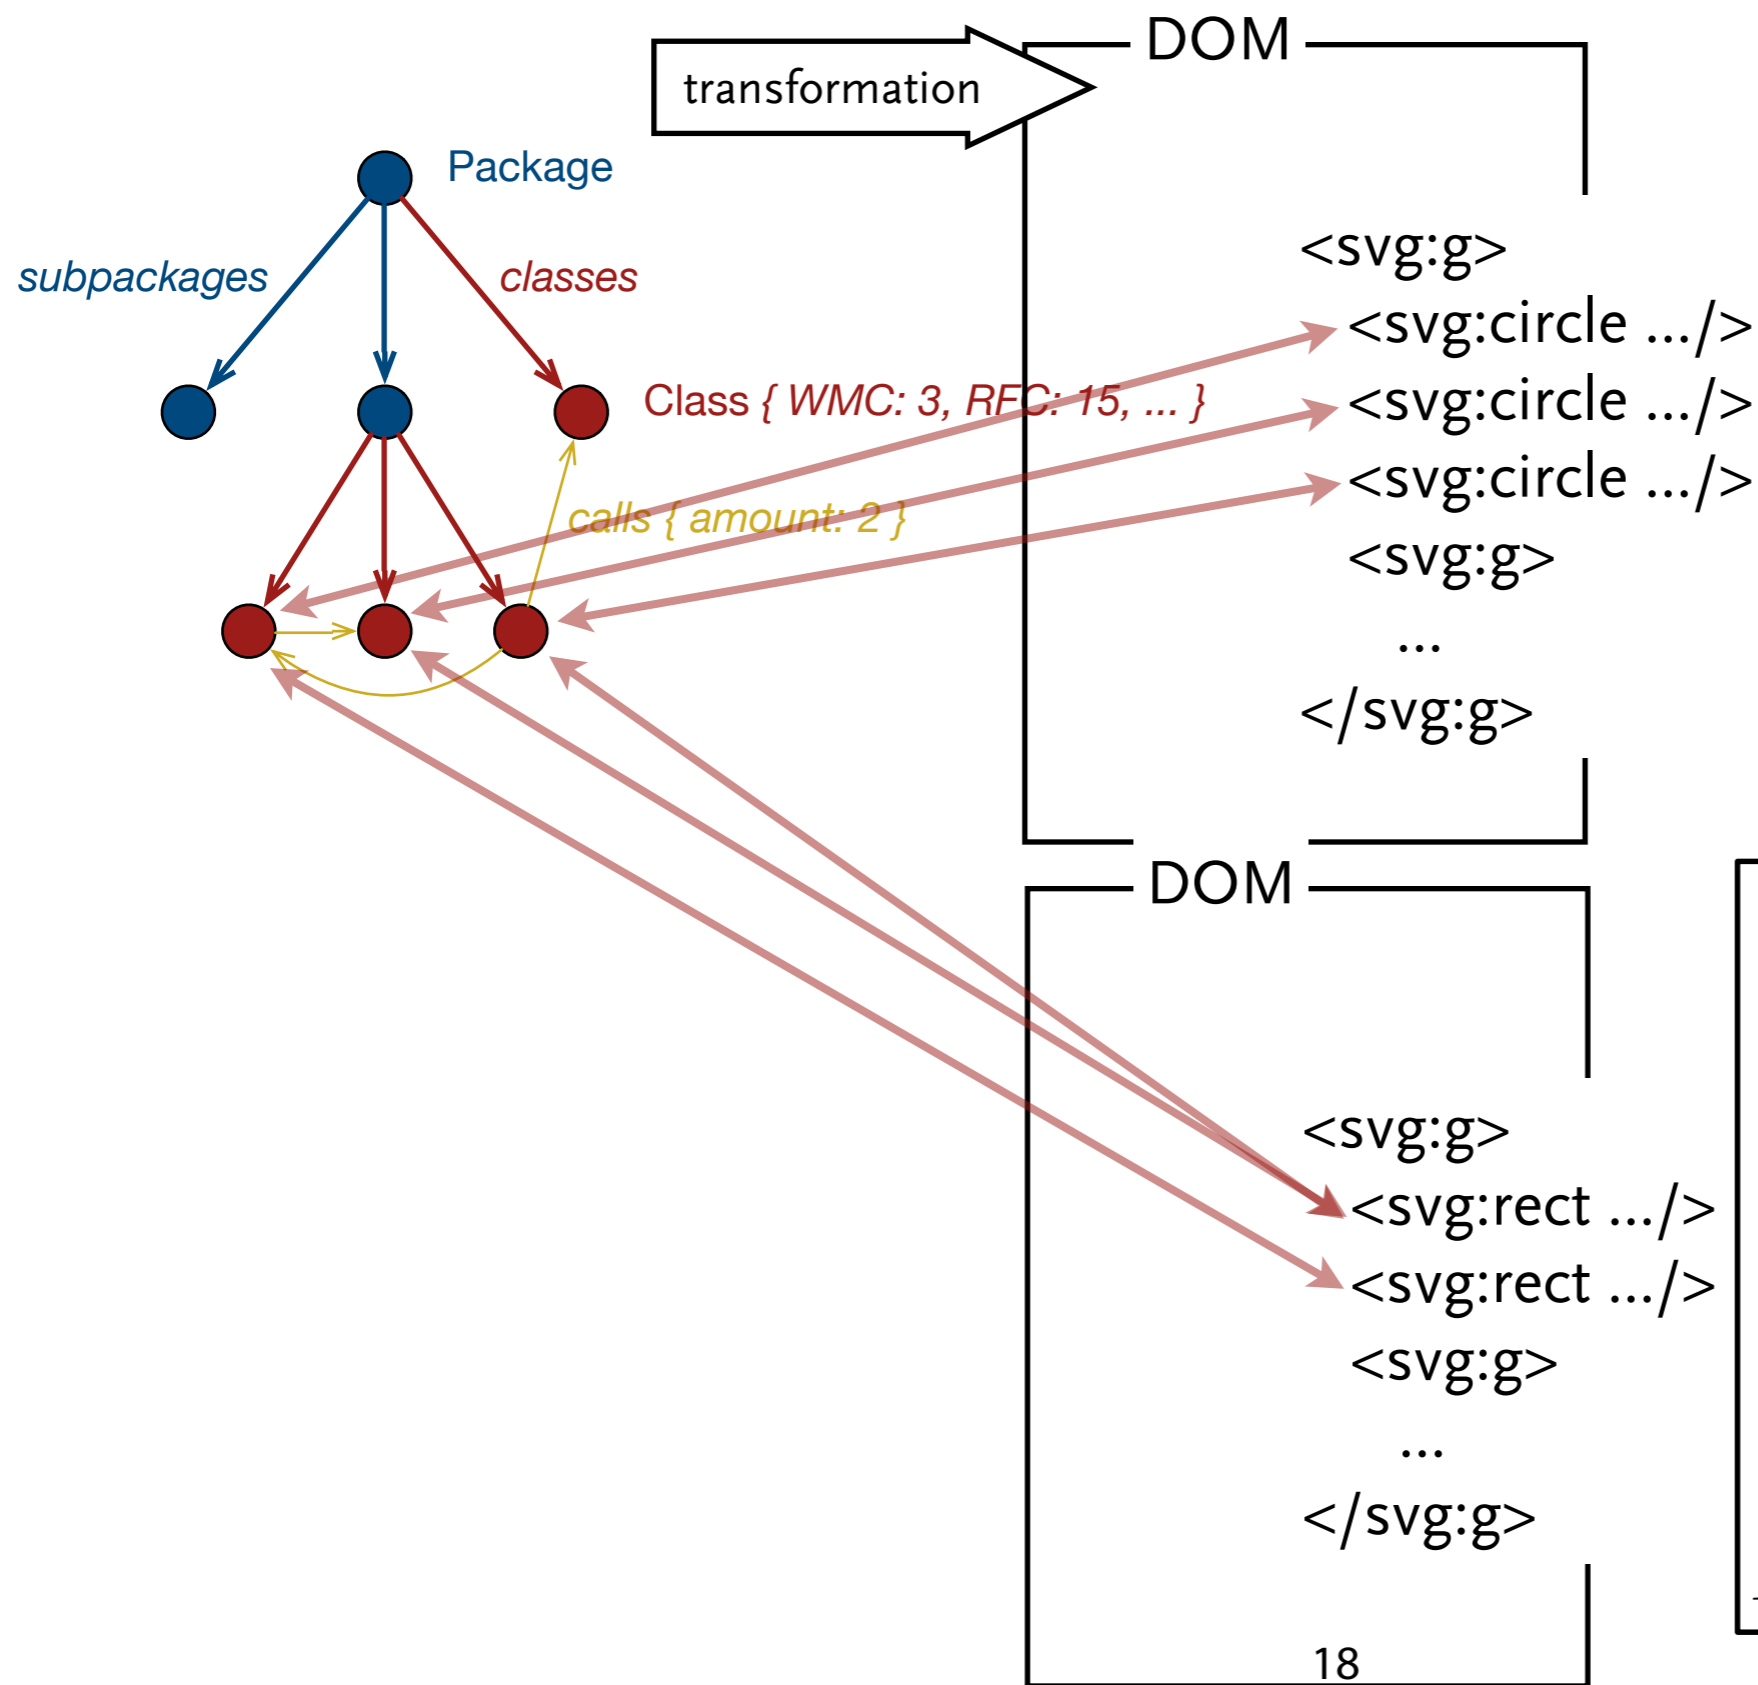

Interactive Visualization Language

d3ng – An interactive visualization framework

```
<d3ng-groups class="chart" (selectedChanged)="selection=$event.selected"  
  [groups]="[0]" [context]="context">  
  <d3ng-scatter-plot d3ngSource [source]="data"  
    pattern="container"  
    x="x" y="y"  
    [config]="scatterPlotConfig">  
  </d3ng-scatter-plot>  
</d3ng-groups>
```

```
<d3ng-scatter-plot class="chart" d3ngSource  
  [source]="selection"  
  pattern="container/contents" [allowEmpty]="true"  
  x="x" y="y"  
  [config]="scatterPlotConfig">  
</d3ng-scatter-plot>
```

```
data = [{  
  type:"container",  
  x:1, y:1  
  children: [{  
    type:"contents",  
    x:0.85, y:0.85  
  },...]  
},...]
```

Conclusions

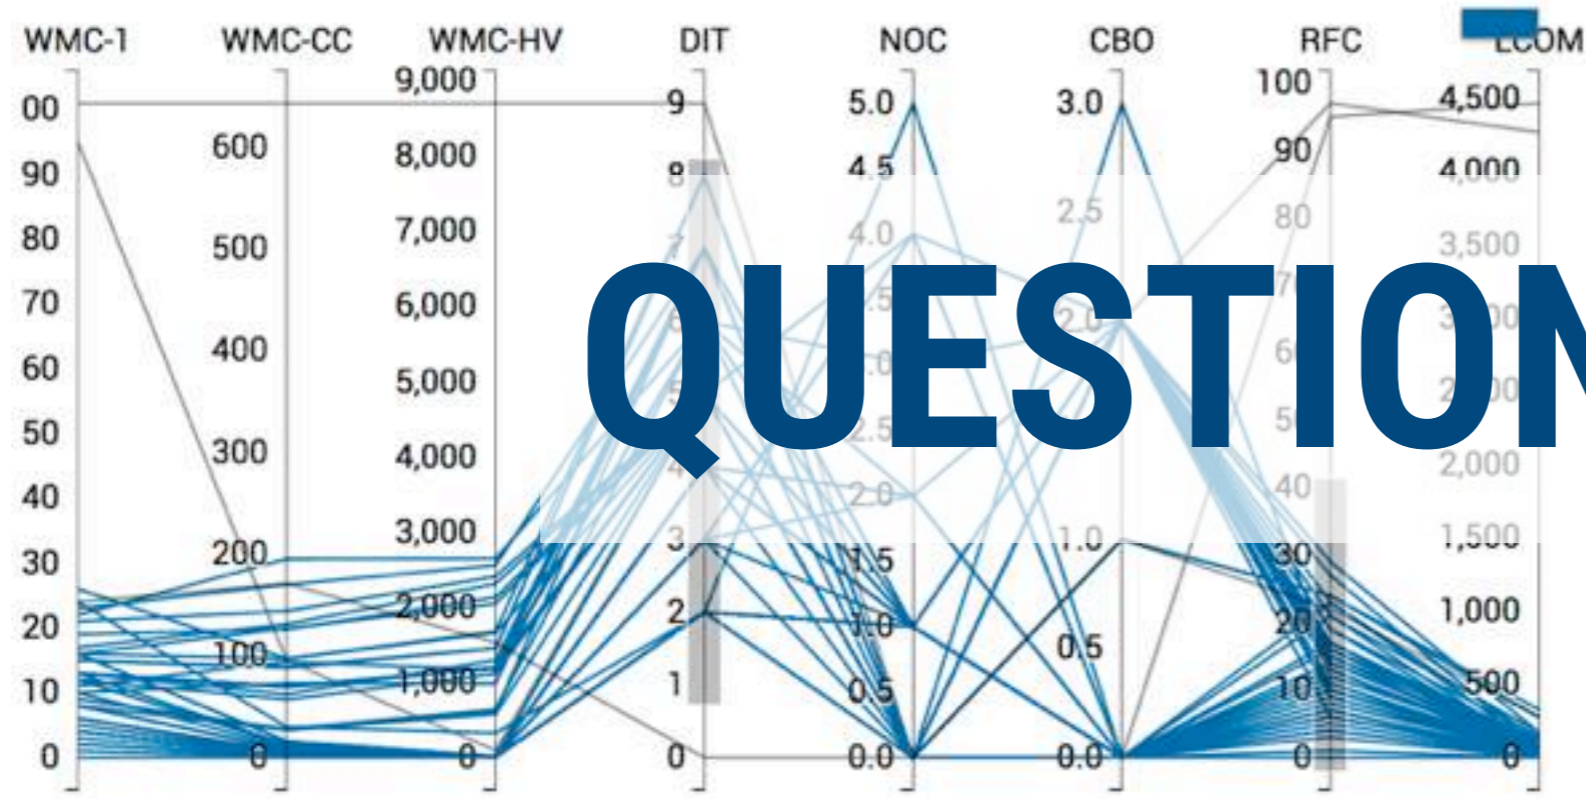

- ▶ interaction is an important tool in visual analytics to explore complex data-sets
- ▶ visualization of software requires the combined visualization of hierarchies, dependencies, and metrics
- ▶ we build a web-component framework that facilitates the creation of complex interactive visualizations of software called **d3ng**
- ▶ demos and more information: d3ng.github.io

Future Work

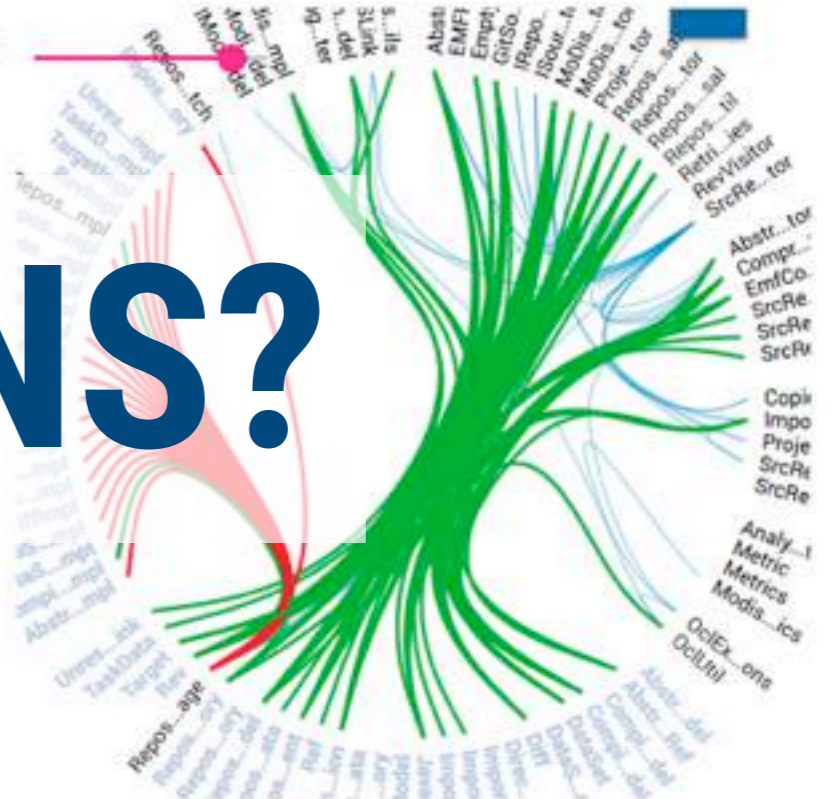

- ▶ web components for an extendable visualization grammar
- ▶ intensional representation of selections: functions rather than sets

Filter based on class metrics

Inspect dependencies of filtered classes

QUESTIONS?

Analyse relationships between metrics of filtered classes.
